About NAMI

NAMI, the National Alliance on Mental Illness, is the nation's largest grassroots mental health organization dedicated to building better lives for the millions of Americans affected by mental illness.

Acknowledgements and Gratitude

This report was prepared by the staff of NAMI, led by Stephanie Pasternak with contributions from Brandon Graham, Jessica W. Hart, Angela Kimball, Jodi Kwarciany, Renee Pineda, Shannon Scully, Jennifer Snow and Hannah Wesolowski. NAMI is grateful to executive directors and public policy leaders from NAMI State Organizations for providing information on their legislative priorities and accomplishments that serve as the basis for this report. We are also grateful to Greg Hansch and Alissa Sughrue (NAMI Texas), Peggy Huppert (NAMI Iowa), Alisa LaPolt (NAMI Tennessee), Monica Luke (NAMI Massachusetts) and Ken Norton (NAMI New Hampshire) for providing insights into their advocacy strategy for the spotlights in this report.

Additional thanks are extended to NAMI staff members who helped to edit (Danielle Hall) and to provide key facts and figures (Elizabeth Stafford), and to Pamela Krikorian, the designer of this report.

Finally, we deeply appreciate NAMI grassroots advocates who communicate with legislators to make mental health a priority in state legislatures across the country.

Introduction

NAMI State Organizations bring the voice of people with lived experience of mental illness and their family members to the policymaking process to create positive and systemic change.

Overview

In 2019, an extensive number of mental health-related bills were introduced and passed in state legislatures across the country, indicating that policymakers may be reaching a turning point in their awareness of mental illness, which affects one in five adults and one in six adolescents each year.

Yet, awareness alone does not equal access to mental health services and supports that individuals and families affected by mental health conditions need to thrive. The mental health community still faces many challenges. In fact, well over half of the people who need mental health treatment do not receive it in any given year.

Formed in 1979 by a small group of families of adult children with serious mental illness, NAMI has grown into a nationwide grassroots network. With more than 600 state and local affiliates, NAMI is dedicated to improving the lives of individuals and families affected by mental health conditions. A pillar of NAMI’s mission is advocating for public policies that ensure individuals and families can get help early, get the best possible care, and be diverted from criminal justice system involvement.

Many mental health policy decisions are made at the state level. Historically, care for people with mental illness was considered the responsibility of the state government, and even now states have tremendous control over the design and funding level of their state mental health systems. NAMI State Organizations bring the voice of people with lived experience of mental illness and their family members to the policymaking process to create positive and systemic change.

This report is a showcase of significant state mental health legislation that was enacted (or nearly enacted) in calendar year 2019. The report explains key trends in mental health policy and offers lessons from NAMI State Organization leaders who played an important role in shaping some of these policies.

The report is intended to offer policy options for state policymakers, NAMI State Organizations, and other mental health advocates to pursue in order to improve the lives of individuals living with mental health conditions and their families.
Structure of Report
The report is divided into three main sections based on the pillars of the NAMI 2020–2025 Strategic Plan:

- **Section 1 “People Get Help Early”**
- **Section 2 “People Get the Best Possible Care”**
- **Section 3 “People Get Diverted from Criminal Justice System Involvement”**

Within each section, bill analysis is framed around several “areas of focus.” There are 12 areas of focus in total. These areas of focus are not exhaustive; instead, they represent issues of critical importance to NAMI’s mission that also saw significant legislative action in 2019. In each area of focus, key trends and standout bills are identified and briefly analyzed.

Bills are organized into mini-tables within each trend area and are also listed in this bill reference resource for further review. Bills that fit more than one section or area of focus are listed in all to which they apply. Bills that were vetoed are noted with an asterisk “*” after the bill number.

Other special components of the report include “Understanding the Issue” features that provide a deeper dive on complex mental health policy issues and “Advocacy Spotlights,” which showcase a NAMI State Organization’s involvement with a key piece of legislation and illustrate how other advocates may replicate their success.

Methodology
This report is focused on standalone mental health legislation that was enacted or nearly enacted in calendar year 2019. The research for this report was conducted primarily using legislative tracking software (Quorum). Only bills that had reached the minimum status of “Passed Second Chamber” in 2019 were considered for analysis. A secondary source of research were NAMI State Organizations’ 2019 state legislative summaries (when available). Review was limited to legislation from the 50 states and Washington, DC.

Bills that did not meet the threshold of having “Passed Second Chamber” (i.e., those that did not advance far into the legislative process) were not included in this report, except where otherwise noted. State budget and appropriations bills were excluded due to the vast differences in how states fund and administer their mental health services and programs across state.
agencies and county/local entities. There are a few exceptions in which budget bills are mentioned in this report to discuss a specific provision from that bill. Finally, bills that did not meet one of the “areas of focus” for this report, or bills that were not primarily mental health-focused, were also excluded.

Note that mental health policy spans many issues, all of which are important and worthy of policymakers’ attention. However, in the interest of creating an accessible, brief and usable document for advocates and other interested parties, the report’s scope had to remain limited and, therefore, this report is not comprehensive of all possible issue areas and related legislation.

Even within these limits, over 600 state mental health bills were collected for consideration in this report. Upon further refinement, nearly 100 bills were included in the final report.
People Get Help Early

Growing evidence shows that when people get help early, it can reduce the long-term symptoms of their conditions. “Getting help early” means providing connections to care, identifying symptoms of a mental health condition early, and intervening with evidence-based and effective treatments as soon as possible to help an individual get well and stay well.

When people get help early, it can change their life's trajectory. Strategies to ensure people get help early include offering mental health education in schools to build awareness and acceptance of mental health conditions and symptoms. It also includes providing school-based or school-linked mental health care to make sure every school-age child can get needed mental health services and supports. But getting help early is not limited to youth and young adults. NAMI believes that all individuals — from youth through adulthood — should have access to care at the earliest signs or symptoms of a mental health condition, including reducing risk factors for suicide.

In this section, we review key trends in legislation in three areas of focus:

1. Early Intervention
2. Mental Health Education
3. Suicide Prevention

The legislation covered in this section is aimed at increasing the early identification, support, and treatment of mental health conditions for children and adults.
Early Intervention

Typically, a person experiencing early episodes of a mental health condition faces long delays before getting treatment that helps. However, recent research shows that early intervention and treatment dramatically impacts the course of mental illness. With effective and timely treatment, early intervention can prevent symptoms from becoming worse, helping an individual continue to stay engaged socially and in school or work. While half of mental health conditions develop by age 14, and 75% by age 24, early intervention is important at all ages — regardless of when symptoms first arise in a person’s life.

What does early intervention look like?
Early invention is most often understood to mean early detection and treatment of mental health symptoms before symptoms become unmanageable. While this is true, early intervention can also include other individual and community-level strategies, such as:

- Mental health awareness promotion, education and prevention programs;
- Creating safe and supportive communities where people have options to seek help and support; and
- Reducing mental health risk factors, such as poverty, homelessness, unemployment, suicidal thoughts and access to illicit substances.

Trends in 2019 Early Intervention Legislation

Early Childhood Development
States are increasingly investing in children’s early social and emotional development. These programs are focused on young children, recognizing the opportunity to identify children at risk for serious emotional disturbance (SED) and intervening early to achieve the best outcomes.

Iowa’s enacted HF 690, which required the creation of a children’s behavioral health system with its own unique core services and created a state board for oversight, is a highlight in early intervention policy from 2019 (read more about this effort in the Advocacy Spotlight on page 10).

In Iowa, caring for people with mental health conditions had traditionally been the responsibility of counties, rather than the state. This approach led to huge disparities in what services families could access based on where they lived. Many hurdles contributed to Iowa’s challenges, especially workforce shortages, as there are only 55 child psychiatrists in Iowa. NAMI Iowa Executive Director Peggy Huppert explained that this has meant families face three to four months-long waiting lists for services and traveling several hours to see a provider.

In 2019, NAMI Iowa and other advocates made the first step to address their lack of a coordinated children’s mental health system by passing a state law (HF 690) guaranteeing the development of a statewide children’s mental health system to support all Iowan families. Iowa HF 690 established a children’s behavioral health system, a related board and required specific services to be available statewide.

Momentum for this change first came in 2018 when Governor Kim Reynolds (R) signed an executive order to create the Children’s Mental Health Board, comprised of patient/family advocates (including NAMI Iowa), elected officials, providers, health plans and other stakeholders. Charged with creating a plan for a viable children’s behavioral health system to help families no matter where they lived in the state, the Board had a plan to take to the state legislature by December.

Ultimately, that plan became HF 690, which laid out a vision for a comprehensive children’s mental health system. Most significantly, the bill mandated a specific set of services for children that must be made available in every region of the state by set dates. The bill also mandated crisis services, which were virtually non-existent for children with behavioral health concerns, said Huppert.

HF 690 was passed with overwhelming support in both chambers. “We had the right group of people at the right time with the right amount of pressure to get it done,” said Huppert.
While the bill had widespread support, NAMI Iowa and their partners did encounter some opposition, including concerns on a provision to require universal behavioral health screening for children. “The stigma surrounding mental health is so strong for some communities that we had parents tell us, ‘I don’t want my kid getting any diagnosis because it will mark them for life,’” explained Huppert.

Finding funding for the new system is the most critical roadblock to implementation, and the COVID-19 pandemic will certainly have an impact. Another challenge is to hold providers, legislators and government agencies accountable to the timeline, even amid the pandemic. Huppert believes that is NAMI’s role. “We, as NAMI, have to bring up the issues that no one else will,” she said.

Despite ongoing challenges, NAMI Iowa knows that the state has taken a huge step toward ensuring children and families can access life-changing care. “It is now the law in Iowa that we have a system of care for children,” said Huppert. “By certain dates, services are to become available. They are not suggestions; they are mandates. I know that people like me and organizations like NAMI are going to continue to put pressure on regions and providers to make sure that those promises are fulfilled.”

**Advocacy Spotlight**

**IOWA**

“It is now the law in Iowa that we have a system of care for children.”

---

**NAMI Iowa’s Keys to Success**

Looking back at the passage of HF 690, NAMI Iowa shared the following advice for other mental health advocates:

**Go Big and Plan for the Long Haul**

Be willing to negotiate, but only when it proves absolutely necessary and not simply to make your bill’s passage more likely.

**Recruit Powerful Allies**

Find support in your community and activate broad coalitions to help tackle issues that affect mental health.

---

**Build Relationships with Legislators**

Look at your state representatives to see who has the power and influence to help you meet your goals.

**Hold Systems Accountable**

Bring the power of lived experience to the negotiating table and add oversight mechanisms into the bill language to hold key stakeholders accountable.
Early Psychosis

Early or first-episode psychosis (FEP) refers to when a person first shows signs of losing contact with reality, such as hallucinations or delusions. This episode of time is critical to connecting a person with potentially life-changing treatment. Sadly, this opportunity is often missed because the type of treatment most effective for FEP, known as coordinated specialty care (CSC), is not widely available. However, in 2019, Illinois and Washington sought to expand access to CSC with new laws aimed at addressing funding barriers for CSC.

Examples of 2019 Legislation Addressing Early Psychosis

Understanding the Issue

Coordinated Specialty Care for First Episode Psychosis

Coordinated specialty care (CSC) for First Episode Psychosis (FEP) is a highly effective, evidence-based intervention which helps young people experiencing early psychosis reach their recovery goals. Every year, roughly 100,000 youth and young adults experience a first episode of psychosis, which can involve loss of contact with reality, such as hallucinations — seeing or hearing things that others do not — or delusions — beliefs that are not based in reality. Psychosis is often associated with schizophrenia and related mental health conditions.

Inadequate and delayed treatment can take a heavy toll on individuals and families. Schizophrenia costs the U.S. economy an estimated $155.7 billion a year in direct health care costs, unemployment and lost productivity for caregivers. Historically, treatment for psychosis has started only after crises — frequently long after the first episode of psychosis. At that stage, treatment is often limited to managing symptoms rather than promoting wellness.

The Recovery After Initial Schizophrenia Episode (RAISE) study by the National Institute of Mental Health (NIMH) showed that FEP programs delivering the CSC model help young people with psychosis get significantly better. This team-based model promotes early intervention and includes recovery-oriented psychotherapy, case management, medication management, family support and education, supported education and employment, and peer support services.

FEP programs delivering CSC are setting a new standard of care and are changing the trajectory of mental illness, including reducing the severity of symptoms, resulting in fewer hospitalizations, and helping young people stay in school longer, get back to work and stay socially connected.

Despite the strong research base, funding remains a challenge for FEP programs. In part due to NAMI’s advocacy, the federal Community Mental Health Services Block Grant provides a base level of money for FEP programs in states. Unfortunately, that funding is not adequate to make programs readily available to all who need it. Medicaid plans and commercial health insurance typically do not cover the full cost of FEP programs, especially the critical component of supported education and employment, as well as outreach to the community. Because of this, additional funding is needed to sustain effective, evidenced-based FEP programs.

NAMI believes that every young person experiencing psychosis deserves to realize the promise of hope and recovery. States should consider dedicating general funds to expanding FEP programs, making CSC available to everyone who needs it. Additionally, states should explore innovative ways to ensure program sustainability by developing alternative payment models within state Medicaid programs and regulating coverage for CSC within commercial insurance plans (see IL HB 2154).

For additional resources on Coordinated Specialty Care, see:

NAMI’s First Episode Psychosis Programs: A Guide to State Expansion
NIMH’s research on Recovery After an Initial Schizophrenia Episode (RAISE)
Education is an essential strategy for removing the stigma associated with mental health conditions. The general lack of visibility and discussion around mental health in our society has contributed to children growing up with little or no understanding of what mental health is, how to identify symptoms, how to support their peers and, most importantly, how to manage their own thoughts and emotions.

Health education is a common component of many students’ education experience. With depression and anxiety on the rise in youth, incorporating mental health into health education programs, or adding stand-alone mental health curricula, is critical to support youth mental health. This is why NAMI has given priority to growing mental health education in schools as a key objective in NAMI’s 2020–2025 Strategic Plan.

**What does mental health education look like?**

Connecting youth to the right services and supports starts with teaching them how to recognize mental health challenges in themselves and others. Mental health education can teach students from an early age how to talk about mental health, how to recognize signs and symptoms of mental health challenges in themselves as well as friends and family, and where they can go for help.

Beyond mental health curricula, schools can further support students by adopting policies and training programs for staff geared toward supporting youth with mental health challenges and connecting them to services. Examples can include training school personnel on how to recognize the signs and symptoms of mental health conditions and intervene, introducing wellness programs into schools, and developing school processes for regularly notifying students and parents of available mental health resources.

**Trends in 2019 Mental Health Education Legislation**

**Mental Health Curricula**

Building up mental health education in primary and secondary schools can significantly reduce the stigma around mental illness, as well as help youth identify symptoms personally and among peers and know how to seek help. In 2019, several states required schools to incorporate mental health into their health curricula or expanded their existing mental health education requirements.

Texas’s enacted SB 11 was a highlight in mental health education policy in 2019. The bill requires public school districts to add mental health and suicide prevention education to their curricula, increase school personnel’s capacity to support students’ mental health, and increase community-based mental health treatment for children. The law was enacted in a challenging environment that many mental
health advocates face in the wake of incidents of mass violence. Read more about this effort in the Advocacy Spotlight on page 16.

Advocacy Spotlight

TEXAS

Changing School Climate with Mental Health Education

SB 11 requires that mental health be a part of students’ education.

On May 18, 2018, a school shooting in Santa Fe, TX, resulted in the death of eight students and two teachers, making it the third-deadliest high school shooting in the U.S. to date. In the aftermath of such tragedies, lawmakers often turn to mental health reform, despite recent studies indicating that mental illness does not drive mass violence. Yet even in this challenging environment, NAMI Texas found success advancing student mental health while fighting stereotypes and misinformation about mental illness with Senate Bill 11 (SB 11).

During the legislative session, NAMI Texas made investing in student mental health and wellbeing a top priority. According to NAMI Texas Executive Director Greg Hansch, it was clear that “all too often, children fall through the cracks and their mental health conditions aren't addressed until it is a crisis situation.” Research backs up this claim, showing that the delay from the onset of mental health symptoms to treatment is an average of 11 years.

SB 11 requires that mental health be a part of students’ education and school personnel be trained in how to respond to youth experiencing mental health challenges, and it also boosts the children’s mental health workforce. However, the original bill was not a “mental health” bill, it was focused on school safety, violent threats and emergencies. That changed when NAMI Texas and allied organizations succeeded in attaching several amendments to SB 11, adapted from priority bills that had died earlier in the session.

To build support for SB 11 and the need for mental health resources in schools, NAMI Texas worked with the Texas Coalition for Healthy Minds, a diverse coalition of groups dedicated to improving mental health and substance use care in Texas. NAMI Texas identified a unique role they could play in the SB 11 campaign by bringing attention to the role of parents in student mental health. NAMI Texas succeeded in getting language added to the bill that encourages schools to provide parents with mental health information and resources. To make this possible, Alissa Sughrue, Policy Director at NAMI Texas, advocated for language encouraging schools to provide information to parents about mental health.

Mental health advocates gather at the NAMI Texas 2019 Mental Health Capitol Day Rally.
Coordinator at NAMI Texas, explained, “We had to be aggressive about it. Not because anyone was opposed, but because groups consistently forgot about the parents in this issue.”

The biggest challenge NAMI Texas had was repeatedly needing to educate legislators and their staff that mental illness does not cause violence. Attitudes started to change after a hearing on SB 11 when NAMI Texas decided to shift their messaging strategy. “Rather than talking about what does not cause violence, we decided to start talking about what is connected to violence, and that made a big difference,” Sughrue explained.

Ultimately, NAMI Texas and their partners’ advocacy transformed SB 11 from a bill that largely addressed the physical security of school buildings to a broader effort aimed at creating the best possible climate for students to learn and thrive. NAMI Texas is especially excited about the long-term impact of bringing mental health education into the schools. “[This policy change will] facilitate more understanding among public school students,” said Hansch. “They often don’t have any foundation of knowledge about mental health because it’s not something they have been educated on before. So, when they see their fellow students having a hard time, they mistake it for something else and may stigmatize and bully when their classmate/peer is struggling. This provision will help them better understand what their classmates are going through and how they can help their classmates, friends or peers access care.”

**Advocacy Spotlight**
**TEXAS**

“This provision will help them better understand what their classmates are going through and how they can help their classmates, friends or peers access care.”

**NAMI Texas’ Keys to Success**

Looking back at the passage of SB 11, NAMI Texas shared the following advice for other mental health advocates:

**Fight Myths with Facts**

Do not allow mental illness and violence to be tied together. Relentlessly educate decision makers about mental illness and the complexities of predicting violence.

**Scout for Opportunities**

Look for other avenues for legislative successes if your priority bills hit a roadblock. NAMI Texas became involved with SB 11 later in session, but they were still able to leave their mark on the bill by inserting key priorities.

**Reflect Marginalized Communities**

Examine policies and language for blind spots or disproportionate consequences toward marginalized communities.
School Protocols and Staff Training
School personnel can be critical to identifying early symptoms in students and connecting them to care. Several bills in 2019 required schools to design and implement new policies and protocols to promote their students’ mental health and wellness, as well as train school personnel on how to recognize and respond to signs of a mental health condition or crisis, including suicidal ideation.

A 2019 highlight in this area of policy was Washington’s SB 5903, which requires widespread mental health supports to be available and requires trainings for staff. Specifically, the bill requires coordination and training on behavioral health for school district staff, requires the state to provide infant and early childhood mental health consultations to parents, and requires a statewide plan to develop school-based supports for students.

As the 10th leading cause of death in the United States, suicide is a national public health crisis. In 2018, 10.7 million adults seriously contemplated suicide, including 3.3 million who made suicide plans and 1.4 million who made a nonfatal suicide attempt. Although suicide is rarely caused by any single factor, experiencing a mental health or substance use condition elevates a person’s risk for suicide.

According to the CDC, rates of suicide have increased in nearly every state since 1999. Some demographic groups have seen sharper increases, with dramatic spikes in suicide rates for Black youth and in rural and frontier communities.

Many factors contribute to suicide among those with and without diagnosed mental health conditions. Regardless of an individual's history, suicidal ideation represents a mental health crisis that requires an early and immediate mental health response with supports like crisis counseling.

**What do suicide prevention strategies look like?**

Because there is no single cause of suicidal ideation, there are several policy strategies that have been effective in preventing suicide or reducing suicide attempts. First, state legislation may focus on reducing factors that increase risk of suicide, including creating suicide prevention programs that promote outreach and reduce isolation for at-risk students. Additionally, states have pursued strategies that promote resilience and coping strategies at all levels of society (individual, family and community). For example, recent legislation in Louisiana (HB 53) requires school staff to educate students on coping strategies and warning signs of mental health conditions and requires schools to identify a person in the school who can serve as a point of contact for at-risk students. Other bills have encouraged special training to help school personnel communicate with family members about these issues and direct families to appropriate resources.

**Trends in 2019 Suicide Prevention Legislation**

**State Bodies to Study and Develop Suicide Prevention Strategies**

In reaction to state-level crises, states will often pursue legislation to create a cross-functional body to study the impact of the issue and explore solutions that will work within that state given its unique make-up. Responding to the growing rates of suicide, in 2019 state policymakers pursued establishing commissions and other bodies to study the issue and develop systemic suicide prevention strategies (MI SB 228 and OR SB 707). In one case, a state sought to specifically examine the issue of suicide in Black youth (NY A6740B).

Suicide Prevention Training
Suicide rates for young adults are particularly high, with suicide being the second-leading cause of death for people aged 10–34 years old. As a result, state policymakers worked in 2019 to implement trainings on how to recognize and respond to the warning signs of suicide for students and school personnel in primary and secondary schools and higher education settings (HI SB 383; LA HB 53; NV AB 114; NV SB 204; NH SB 282; OR SB 52; and TN HB 1354). Lawmakers also focused on suicide prevention programs for first responders (NJ A 1028 and NV SB 483). An outlier and notable highlight in suicide prevention legislative activity was Maryland’s HB 77, which decriminalized attempted suicide.

Nevada’s enacted legislation, SB 204, was a high point in suicide prevention policymaking in 2019. The legislation required a multi-faceted policy for suicide prevention to be adopted by each public and private school that will include prevention procedures, outreach and training. Implementation will be supported by a provision requiring the development of a model policy for schools to follow. More broadly, the law also adds mental health into schools’ health education courses.

OTHER AREAS OF FOCUS

People Get Help Early

**Mental Health Professionals in Schools**
To bolster students’ access to mental health care in educational settings (primary, secondary and higher education), some states have set minimum student-to-mental health professional ratios (KY SB 1; IL HB 2152; and WA HB 1355) and encouraged partnerships with local mental health treatment providers (CA SB 75).

**Foster Care System Reform**
In 2019, states prepared for foster care system changes to implement both mandatory and optional components of the federal Family First Prevention Services Act (FFPSA), which was passed in 2018 with implementation ongoing. These changes focused on compliance with mandatory federal congregate care requirements and development of optional prevention services programs for children “at-risk” of entering foster care (CO HB 19-1308; MT HB 604; NH SB 14; OR SB 221; TX SB 355; TX SB 781; VT H 532; WA HB 1900; WV HB 2010).

**Multi-System Youth**
Another theme of 2019 state policymaking was to study the unique needs of multi-system youth (ND SB 2313) and several efforts to support youth in the juvenile justice system specifically. This included state legislation clarifying the civil rights of justice-involved youth (IL HB 2649); defining acceptable standards for holding, incarcerating and discharging juveniles (MS SB 2840); and establishing requirements for justice-involved juveniles’ access to mental health treatment and other programming (IL HB 3704 and NH SB 14). Other notable bills increased resources for homeless youth (CA AB 1235) and youth that had been sex-trafficked (MS HB 571).

**NOTE:** Any bills listed in the section are not included in the Bill Reference Resource. Use links for more information.
People Get the Best Possible Care

One in five adults in the U.S. experiences a mental health condition, but less than half receive treatment. NAMI’s priority that every person “get the best possible care” means that comprehensive mental health care should be the standard for everyone in our country, with access to quality treatment when and where people need it.

When people get the best possible care, they have health insurance that includes parity coverage of mental health and substance use care. They are also able to access a full continuum of culturally competent mental health services and treatment options. To do that, NAMI supports policies that expand the mental health workforce and inclusion of peers and families in decisions that impact them.

In this section, we focus on legislation in six areas of focus:

1. Medicaid and State-Regulated Health Insurance Coverage
2. Mental Health and Substance Use Parity
3. Medication Access
4. Continuum of Mental Health Services
5. Mental Health Workforce
6. Inclusive and Culturally Competent Care

The legislation covered in this section is aimed at expanding and ensuring access to effective treatment options and quality and affordable care.
NAMI believes that all people with mental health conditions deserve accessible, affordable and comprehensive health care. This is critical for individuals with mental health conditions to access care for both their mental and physical health needs. There are a variety of types of insurance coverage, governed by both federal and state governments. States play a significant role in Medicaid plans, as well as fully insured health benefit plans and state employee health benefit plans (collectively referred to as “state-regulated coverage” in this report).

Medicaid is the public health insurance program for individuals with low income and is the single largest payer of mental health services in the U.S. In fact, Medicaid covers more than one in four non-elderly adults with serious mental illness. While Medicaid benefits vary from state to state, Medicaid plans usually offer more comprehensive mental health benefits than private insurers. And more people have been able to get Medicaid coverage in recent years due to the Affordable Care Act (ACA), which made Medicaid expansion possible.

State-regulated plans represent a significant portion of the private health insurance market. The most common examples of state-regulated plans include individual and small group plans, such as those available on the federal health insurance exchange (Healthcare.gov) and state-based exchanges.

What should health insurance coverage for mental health care look like?
Every health plan should include mental health benefits that are comprehensive, accessible and affordable — and covered at parity with other types of health care benefits. Mental health benefits should cover a range of mental health services spanning from outpatient to acute care, and an extensive variety of mental health professionals should be covered. Coverage should be barrier-free, meaning individuals should not have to jump through any administrative hurdles, such as work requirements, to sign up or maintain their coverage.

Trends in 2019 Medicaid and State-Regulated Health Insurance Coverage Legislation

Medicaid Coverage
To date, 39 states (including Washington, DC) have expanded Medicaid as allowed in the ACA. Medicaid expansion has proven to be a critical source of coverage and care for persons with mental health conditions.

Sadly, most of the legislative action in 2019 on Medicaid expansion involved state legislatures pursuing only limited expansions, including some that rolled back voter-approved full Medicaid expansion, while other bills would have restricted access to
services by adding barriers such as work requirements. NAMI opposes any effort to take Medicaid coverage away from people who do not meet a work requirement. Instead, NAMI urges all states to expand Medicaid, as indicated in the ACA, to ensure more people with mental health conditions have access to essential health care services and supports.

In 2019, Tennessee sought to become the first state to condense their Medicaid funding into a block grant with HB 1280 and a subsequent waiver proposal. NAMI opposes block grants or per-capita caps in Medicaid, which impose financing limits that jeopardize coverage and services for individuals with mental health conditions. Read more about the impact of block grants and NAMI Tennessee's efforts to protect Medicaid funding in the Advocacy Spotlight on page 28.

One notable exception and positive development in Medicaid legislation in 2019 was North Dakota’s SB 2012. Not only did the bill extend the state’s Medicaid expansion program through July 2021, the bill expanded the number of Medicaid-covered mental health services and mental health professionals to better serve people with serious mental illness.

</tr>
</tbody>
</table>
Medicaid is one of the most important pathways for people to receive mental health care. Medicaid is traditionally funded with an open-ended funding formula that allows the program to easily expand to serve those in need. Yet in 2019, Tennessee became the first state in the nation to take a step toward forgoing the traditional Medicaid funding formula and implementing a block grant, putting individuals with mental health conditions and their families at risk of losing coverage and care.

After promises from the Trump Administration to provide states with greater flexibility in running their state Medicaid programs, the Tennessee legislature passed HB 1280, a bill ordering the state’s Medicaid agency to seek a waiver to transform their federal Medicaid funding into a single lump-sum block grant, which would cap funds from the federal government and jeopardize care.

The resulting Medicaid waiver proposal concerned health advocates across the state (and country). NAMI Tennessee got involved in the waiver process right away, realizing they brought a unique voice to the conversation by drawing attention to the mental health-specific impact of the Medicaid block grant. “I was surprised at the lack of groups that were stepping up to talk about mental health,” explained NAMI Tennessee Director of Public Policy Alisa LaPolt.

NAMI Tennessee’s campaign to protect Medicaid involved sending advocates to attend public hearings on the proposed waiver and offering testimony to put a spotlight on how critical Medicaid funding is to the mental health community. NAMI Tennessee leaders were strategic with their public comments, ensuring they would be heard at the first public hearing on the waiver, when there was heavy media attention. Further, to show the broad opposition to the proposal, NAMI Tennessee mobilized NAMI Affiliates to reach their local advocates, educate them on the issue and activate them to contact policymakers.

Advocates united against the block grant have faced a tough political environment, with both the governor and state legislature leaders enthusiastically supporting the block grant proposal on the argument that, if

Advocates gather for NAMI Tennessee’s 2019 Day at the Hill at the Tennessee State Capitol in Nashville.
approved, it would offer flexibility and even generate savings. (At the time of this report, the waiver is still under review by the Centers for Medicare and Medicaid Services). However, nonpartisan analysis has consistently shown that Medicaid block grants equal Medicaid cuts. “The block grant program is capped at a certain dollar amount, and that is an incentive for the state to save money by cutting programs,” said LaPolt.

Despite the unknown outcome, NAMI Tennessee knows that their advocacy has been effective and worthwhile. LaPolt emphasized why this Medicaid fight was so important to NAMI Tennessee: “We have a responsibility to ensure that all individuals, regardless of income level or employment status, have access to mental health care.”

**NAMI Tennessee’s Keys to Success**

Looking back at their fight to protect Medicaid, NAMI Tennessee shared the following advice for other mental health advocates:

**Simpler Is Better**

Simplify the issue down to its core impact so it can better resonate with both your advocates and legislators.

**Consider Your Word Choices**

How you talk about benefits or programs matters. Avoid using any language characterizing Medicaid as an “entitlement” or “handout.” Equate Medicaid to other types of health insurance; do not say Medicaid “beneficiary” and instead say Medicaid “enrollee” or “member.”

**Understand Political Realities**

Avoid burning bridges if a legislator happens to vote against your policy priorities. You may not have their support for every vote, but if you keep communication lines open and respectful, you can gain their support in the future.

**Seek Out Experts**

NAMI Tennessee reached out to NAMI’s national office for technical assistance in analyzing and responding to the TN waiver proposal.
**Patient Protections in State-Regulated Plans**

The ACA made vast improvements in the availability, quality and affordability of health insurance, including the expansion of mental health as an essential health benefit. However, the ACA’s future is uncertain due to a pending federal lawsuit challenging the law’s constitutionality, which is expected to be decided in spring of 2021, as well as ongoing efforts to chip away at the landmark health law. In response, states have stepped in to take preemptive action to protect individuals by incorporating important ACA consumer protections into state law.

Washington’s HB 1870 is particularly noteworthy as one of the more comprehensive state laws that preserves a wide range of ACA consumer protections, including those most vital to people with mental health conditions. Another bill to note is Maryland’s enacted SB 28, which applies mental health and substance use parity protections to short-term limited duration health plans (STLD), a type of “junk” insurance. NAMI opposes the expansion of STLD plans and has joined a lawsuit to invalidate the federal STLD insurance plan rule. To understand the dangers of STLD plans for individuals with mental health conditions, read this factsheet.

</tr>
</tbody>
</table>
The Patient Protection and Affordable Care Act (ACA) of 2010 included consumer protections to help improve the quality and affordability of health insurance and ended many discriminatory practices. These protections have helped people with mental health conditions gain comprehensive health coverage and receive mental health services.

Before the ACA, state laws had a patchwork of protections that left large gaps in coverage, especially for people who didn’t have employer-based insurance. Policies in the individual or small group insurance market covered fewer benefits and were more expensive, with few states requiring health plans to cover mental health services. Health insurers could deny or cancel health insurance because of having a mental health condition, or charge people more for their coverage. This meant that many people with preexisting conditions, such as mental health conditions or substance use disorders, could not afford private health insurance, and if they could, mental health coverage was often inadequate — if covered at all.

**The ACA changed this by:**

- **Expanding Medicaid coverage** for adults with incomes up to 133% of the federal poverty level.
- **Mandating coverage of mental health** as one of 10 Essential Health Benefits in many health plans.
- **Applying mental health and substance use parity** protections to all new small group and individual market plans so that coverage of mental health and substance use disorder services is on par with medical and surgical benefits.
- **Ending health insurers’ ability to cancel, limit, outright deny, or charge more for coverage** of people with pre-existing health conditions, including mental illness.
- **Prohibiting yearly and lifetime spending caps** so that people are not cut off from critical mental health services during periods of great need.
- **Extending family coverage up to age 26**, giving young adults more coverage options at a time when many mental health conditions first appear.
- **Requiring coverage of a wide range of preventive services** at no out-of-pocket cost.
- **Providing tax credits and cost sharing subsidies to make health insurance more affordable** for individuals and families.

These ACA protections opened the door for many people with mental health and substance use disorders to gain health coverage. For example, before the ACA, many young people were kicked off their parents’ insurance by early adulthood — often a critical time when symptoms of mental illnesses can first appear. Thanks to the ACA, young adults with mental health conditions are more likely to be insured and receive care, reducing the economic and emotional burden on these young adults and their families.
NAMI believes that all people with mental health conditions deserve accessible, affordable and comprehensive health care. At the time of this report, the ACA remains the law of the land, but legal and regulatory efforts have weakened the law and attempted to repeal it entirely. This includes efforts to expand other forms of insurance that do not have these same consumer protections, also called “junk insurance,” which often do not cover mental health and can leave people with few options when they need care. NAMI continues to advocate for comprehensive mental health coverage and consumer protections at the federal level and supports efforts to strengthen state-level insurance requirements, oversight and enforcement.

*For more information on how the ACA impacted health insurance for people with mental health conditions, see:*

NAMI’s *What the Affordable Care Act Has Meant for People with Mental Health Conditions — And What Could Be Lost*
A person’s health insurance plan determines what mental health services they can receive, how much those services will cost and which mental health providers they can see. Too often, health insurance covers mental health care differently than other types of medical services, creating barriers to affordable, accessible mental health care and reinforcing a stigma around mental illness and seeking mental health treatment.

Parity is the basic idea that mental health and substance use care are to be covered at the same level as care for other health conditions. In 2008, Congress passed the Mental Health Parity and Addiction Equity Act (MHPAEA), which required plans that cover mental health and substance use care to provide equitable coverage compared to coverage of medical/surgical treatment. The ACA further expanded the impact of the federal parity law by requiring most health plans to cover mental health and substance use disorder care. To build on this, states have enacted parity legislation to expand protections and/or improve compliance and enforcement of the federal law. These efforts have helped create a more level playing field to treat mental and physical health conditions alike.

**What do state parity efforts look like?**

While MHPAEA is federal law, its enforcement has largely been the responsibility of the states, namely state departments of insurance. Active implementation of parity requirements has been challenging for state regulators and insurers alike. Insurance data shows that the disparity in benefits between what the parity law requires versus what individuals can access is large and is only growing larger.

Fortunately, state policymakers and mental health advocates, including many NAMI State Organizations, have led the call for greater transparency and accountability of parity compliance to stop insurance discrimination against individuals with mental health conditions.

**Trends in 2019 Mental Health and Substance Use Parity Legislation**

A number of states in 2019 advanced or enacted legislation based on the Kennedy Forum's model parity bill, which is endorsed by NAMI and other mental health and addiction advocacy organizations. The model bill establishes reporting requirements for insurers to demonstrate how they design and apply their managed care tactics and specifies how state insurance departments can implement parity and report on their activities.

An often-overlooked element of insurance coverage related to parity is network adequacy. Ideally, insurers will have robust listings of in-network providers for
individuals to easily find the right provider. However, a recent Milliman report discovered that mental health and substance use provider networks are often inadequate, forcing people to go out-of-network. Massachusetts’ enacted H 4210 helps address this problem by requiring insurers to maintain more accurate information on their networks and is a highlight in parity policy from 2019 (read more about this effort in the Advocacy Spotlight on page 35).

</table>
Massachusetts has a serious ghost problem, but haunted houses aren’t to blame. For NAMI members, the “ghosts” are found inside their health plan.

If you have sought out mental health care by calling up your health insurance plan’s list of providers, you may have noticed that few, if any, of the providers listed are truly available. These networks — ones that appear robust on paper but, in reality, don’t exist — are called “ghost” or “phantom” networks. To address this, NAMI Massachusetts fought for H 4210, a new state law aimed at eliminating ghost networks for behavioral health.

Ghost networks for mental health care are a common experience for NAMI families. “Parents would look up the list of providers to help their kids. They’d call up the 50 names listed and by the end they’d just be in tears,” explained Monica Luke, Board Member for NAMI Massachusetts. Providers listed by insurers often aren’t taking new patients, are no longer accepting that insurance, have closed or have the wrong contact information — all of which forces people to look outside of their network to receive care and causes families to pay more.

NAMI Massachusetts partnered with several groups, including the Children’s Mental Health Campaign, the Massachusetts Mental Health Coalition and the Massachusetts Association for Mental Health, to work on state legislation to eliminate ghost networks (S 2295, which was later rolled into H 4210). This broad coalition prioritized holding insurance companies accountable for the information they provide — not only which clinicians are in-network but, more importantly, which clinicians are open to new patients.

Being part of a coalition meant sharing responsibility for the legislation’s progress. NAMI Massachusetts’ role was to ensure that the voice of lived experience would be front-and-center during the process. That meant having members from local NAMI Affiliate organizations testify during committee hearings and also building grassroots support for the bill. NAMI Massachusetts relied on digital advocacy campaigns to activate grassroots leaders and credits those campaigns for helping to get the bill over the finish line. “When our community contacts legislators, it’s much different than a provider or any other stakeholder. These services are for us,” explained Luke.
Additionally, NAMI Massachusetts found a natural ally with providers’ associations, whose members had consistently struggled to get on insurance panels because they were reported as “full” by insurers. Of course, the experience of individuals and families painted a much different picture.

While the strength of the coalition got the legislation passed, implementation of the law has not been without challenges. Compared to other providers, mental health providers may not take as many patients because mental health care is time-intensive, and patients are seen frequently, often once a week or more. However, NAMI Massachusetts was able to collaborate with other members of the Massachusetts Mental Health Coalition on working with the Massachusetts Division of Insurance to prioritize implementation, as well as helping them determine what data needs to be collected to provide an accurate picture of behavioral health providers’ availability.

Despite these challenges, Luke shared that it was easy and straightforward to educate legislators and grassroots advocates on the issue. Luke said, “Once we gave folks an example of what a ghost network was, they immediately understood, probably because they’d encountered one before in their own personal life.”

**NAMI Massachusetts’ Keys to Success**
Looking back at the passage of H 4210, NAMI Massachusetts shared the following advice for other mental health advocates:

**Amplify Your Power Through Coalitions**
Partner with coalitions to expand your capacity to get things done. Often, coalition leads will produce template action alerts and other helpful resources for the benefit of all coalition members, and coalitions with diverse organizations can bring unique and powerful perspectives to the table.

**Seek Community Input**
Take the time to speak directly with your members to better understand what issues are affecting your specific community and learn what advocacy opportunities you might have to make an impact.
The 2008 federal parity law was an unprecedented advancement in mental health coverage and a testament to the advocates, including many NAMI leaders, that ensured its passage. Sadly, ensuring access to comprehensive mental health care is more complicated than ensuring the enforcement of this landmark law. There are limits to where parity applies, how well it can strengthen mental health benefits and the types of insurance discrimination it can address. Fortunately, states are finding solutions to these limitations.

Occasionally, the federal parity law is misrepresented as a cure-all for fixing poor insurance coverage of mental health care. That is largely based on the misconceptions that the federal parity law:

1) applies to all health plans and

2) requires coverage of all possible mental health and substance use services.

In truth, the federal parity law only applies to some health plans. Parity does not apply to Medicare plans, small group self-insured employer-based plans or Medicaid fee-for-service plans.

Additionally, parity only comes into play for plans that have or are required to offer a mental health benefit in the first place. For those plans, the parity law requires mental health coverage that is equitable to medical/surgical health coverage but does not require complete coverage. Understanding these nuances is critical in light of new federal flexibilities that allow for the expanded sale of health plans that have fewer required benefits — including plans that lack mental health benefits altogether. In other words, as junk insurance plans have become more common, mental health parity is at risk.

Further undermining the vision set forth in the parity law is the improper use of “medical necessity” criteria. In March 2018, a federal court found that a subsidiary of UnitedHealth Group used flawed clinical criteria to deny coverage of mental health and substance use services. The court found that they repeatedly deemed mental health and substance use disorder services not “medically necessary,” despite providers’ recommendations, as a strategy for denying care to enrollees and reducing costs. This type of insurance discrimination cannot be addressed by parity strategies, as care is denied too early in the insurance review process for a parity analysis to even be done.

States can help protect consumers from these harmful practices and strengthen the reach and impact of parity laws. States can prohibit, limit or aggressively regulate the sale of junk insurance plans (for example, MD SB 28 that extends parity protections to short term, limited duration plans). States can also ensure that their statutes extend parity protections to all health insurance plans within their jurisdiction (Medicaid and state-regulated plans). Finally, new strategies are emerging for addressing mental health and substance use disorder insurance discrimination based on medical necessity criteria. California’s SB 855, enacted in 2020, is one such trailblazing measure that specifies medical necessity criteria must be based on generally accepted standards of care and that all medically necessary mental health services must be covered by insurance.
Although it may not always be a part of an individual’s mental health treatment, medication can be a valuable tool in a person’s recovery. Access to prescription medications is essential for many people to successfully manage their mental health condition. For individuals who take medications, one size does not fit all. Mental health medications affect people in different ways, and individuals need to be able to use a medication that works best for them.

Research has found that medication access issues for individuals with mental health conditions result in the worsening of symptoms and increased psychiatric hospitalizations and emergency department visits.

Unfortunately, many barriers often make it harder for individuals to get their prescriptions. Common barriers include step therapy (or “fail first”) protocols, prior authorization requirements and preferred drug lists or formulary restrictions. These obstacles can block or delay needed treatment, as well as increase the administrative burden on providers.

**What does protecting medication access look like?**
Protecting medication access is about ensuring the fewest possible barriers come between individuals and the medications that they need. If barriers are in place, such as step therapy or prior authorization, states should require that it is clear how and why those processes are applied, how prescribers and patients can request an exemption from the process if needed, and that psychiatric medications be exempted from these processes as much as possible. For psychiatric medications, it’s also important, regardless of what type of health plan, that formularies be as open as possible and psychiatric medications be categorically excluded from preferred drug lists, which limit patients to certain drugs within the same class.

**Trends in 2019 Medication Access Legislation**
Step therapy reform was the biggest legislative trend in improving access to medications for mental health conditions at the state level in 2019. Step therapy policies are especially harmful to people with mental health conditions. (Read our “Understanding the Issue” on page 40 to better understand the impact of step therapy on the mental health community and state spending.)

Reform efforts in 2019 focused on limiting the use of step therapy, establishing a clear and timely process for patients to request a step therapy exemption from their insurer, and ensuring that patients who are successfully using a specific medication are not forced to switch.
Oklahoma’s 2019 bipartisan step therapy law (OK SB 509) was particularly effective. The legislation requires health plans to establish step therapy guidelines based on clinical practice standards, and it also requires processes for exemptions to be created for any drug subjected to step therapy protocols.

Other trends that improved medication access included establishing clear exemptions from and timelines for prior authorization processes (MD HB 751) and limiting out-of-pocket drug costs for patients with chronic conditions, including mental health conditions (NJ A 2431).

Examples of 2019 Legislation Addressing Medication Access

Understanding the Issue

Step Therapy

Step therapy (also known as “fail first”) refers to an insurance practice that requires individuals to take a lower-cost drug before permitting them to take another, more expensive drug — regardless of what their physician or prescriber recommends. Used to cut costs, step therapy policies are applied when someone is seeking treatment for the first time, but they can also be applied when someone is already taking a pricier medication and doing well on it but switches their health insurance plan.

Step therapy policies are particularly harmful to people with mental health conditions for two reasons:

Mental health conditions are complex. Psychiatric illnesses arise from both biological and experiential factors. For example, different people with the same clinical diagnosis of “depression” may have widely different symptoms and root causes of their condition. As a result, there are no “one-size-fits-all” treatments for any mental health condition.

Psychiatric medications are not interchangeable, even within the same drug class. While psychiatric medications may have similar effectiveness as other drugs in the same drug class, they are unique in how they affect each person and their symptoms. The side effects also impact individuals differently.

NAMI members know all too well how common it is for people to spend weeks, months or even years trying to find the right antidepressant, antipsychotic or other psychiatric medication that helps to manage their symptoms without any intolerable side effects.

The costs of medication failure for people with mental health conditions are substantial. When individuals with mental illness are forced to try and fail on a certain medication simply because it’s cheaper, that process can have disastrous results, including an increased chance of emergency department visits, hospitalization, homelessness, incarceration or suicide.

NAMI believes that individuals deserve access to the full array of treatment options, including access to the right medication at the right time. Due to the unique harms that step therapy poses for individuals with mental health and other complex health conditions, some states have implemented reform to limit the use of step therapy. Notably, in the over 20 states that have enacted step therapy reform legislation, none have shown any actual added costs to the state as a result of that legislation (source: State Access to Innovative Medicines Coalition Step Therapy Fiscal Impact June 2020 Fact Sheet).
The lack of accessible services is a huge reason why 60% of people in need of mental health care never receive it. As the primary administrators of public mental health systems, state governments must figure out how to best allocate and coordinate available resources to close this treatment gap.

Fortunately, studies show that public investment in mental health services is not only effective, but a wise financial decision. For every dollar spent on community mental health services, the return on investment is many times over.

In order to meet their specific needs, individuals and families deserve choices in services, settings and providers. Yet, traditional state mental health systems and funding streams are piecemeal and fragmented, leaving huge gaps in what services are available.

**What does a mental health continuum-of-care look like?**
An effective mental health system for individuals and families affected by mental health conditions requires a full continuum-of-care, a term which refers to the complete range of services and supports that aid in treatment. There is no single course of mental health treatment that is appropriate for all individuals; rather there are many pathways to the successful management of mental health conditions. Read more about the distinct elements in a continuum-of-care in our “Understanding the Issue” on page 43.

**Trends in 2019 Continuum of Mental Health Services Legislation**
While mental health systems often have many gaps, crisis services and intensive services are especially hard to access. In 2019, lawmakers sought to fill common mental health service gaps — such as emergency services and intermediate/intensive care for mental health — by improving health coverage for those services and by defining new types of mental health facilities and services in state law.

Of particular note is Washington’s HB 1394, which contains significant system changes to support individuals with intensive needs. The law creates a new provider type, Intensive Behavioral Health Facility (IBHF), a community-based residential treatment facility for individuals with behavioral health conditions who require care that cannot be met in other settings. This bill further creates Mental Health Drop-In Centers to provide individuals with voluntary, short-term non-crisis services. Finally, the bill aims to increase psychiatric treatment capacity in hospitals for individuals receiving treatment on an involuntary basis.
An additional effort in Texas required local mental health authorities to assess their capacity for providing a wide range of mental health services (TX SB 633).

</table>
Mental health care does not always begin and end in the mental health system. Due to the high rate of justice system involvement for people with mental health conditions, advocates, mental health professionals and law enforcement must partner to divert people with mental illness from the criminal justice system. While many of these efforts have improved responses to people experiencing a mental health crisis, many frontline personnel continue to ask: “Divert to what?”

NAMI developed Divert to What? Community Services that Enhance Diversion, a Mental Health Ecosystem framework that can be used to identify the gaps in services and opportunities that can support these efforts. The Ecosystem can be used as an advocacy tool for speaking with policymakers, but it can also be effective for collaborative groups involving law enforcement, mental health professionals, advocates, and other stakeholders committed to reducing their community’s dependence on the criminal justice system to respond to mental health issues. It identifies supports and services that are often necessary to help people with mental illness maintain their wellness, but it also acknowledges that every community’s ecosystem will look different based on needs, the resources available to meet those needs, and the existing system available to build upon.

Services and supports in the Ecosystem are broken into four categories (peer and family supports should be available across all categories):

**Outpatient Care** is a set of services to support people experiencing symptoms of mental health conditions in getting help early, staying in the community and reducing their need for more intensive — and costly — services later. These services include screenings and assessments for mental health conditions, medications and medication management, cognitive and behavioral therapies, primary health care and treatment for co-occurring disorders.

**Social Support** refers to services that assist in recovery and wellness beyond just medication and cognitive therapy. Access to a safe place to live, income and a supportive community are key pillars to overall wellness. Services include transportation, income supports, housing, supported employment and education, NAMI programs, case management and intensive multidisciplinary programs.

**Crisis Services** include a variety of supports that provide a safe and humane response to someone experiencing a mental health crisis. With a goal to reduce the role of law enforcement and increase connections to community-based care, crisis care should include crisis respite centers, hotlines, mobile crisis units, non-law enforcement crisis transportation and mobile outreach.

**Inpatient Care** refers to mental health care provided in a hospital or residential setting, which can reduce the stress of daily responsibilities for a period for those who require more intensive care. In addition to providing psychiatric services, services should include programming that focuses on life skills that prepare someone to return to their community. Inpatient care includes short-term inpatient care, long-term inpatient care and competency restoration services.

For more information, visit: nami.org/divert-to-what
Many types of professionals deliver the evidence-based cognitive, behavioral and medication therapies that are key to mental health treatment. Those professionals include (but are not limited to): psychiatrists, psychologists, nurses, physician assistants, counselors, marriage and family therapists, social workers and peer support workers.

Unfortunately, there is a severe mental health workforce shortage in the U.S. A 2016 report from the Health Resources & Services Administration (HRSA) shows that certain areas of the country have few or no mental health or substance use disorder treatment providers at all. Workforce shortages are further intensified by problems such as high turnover and job vacancy rates, a lack of specialized providers (e.g., for children or older adults), aging workers, and low salaries and service reimbursement rates in the mental health field.

What does addressing the workforce shortage look like?
To meet the increased demand for services, especially during national crises, states must invest in and support strategies to grow the workforce, train talented professionals and retain their skills within the mental health system. This can include addressing licensure rules, offering financial incentives and expanding the workforce through peer support specialists.

Trends in 2019 Mental Health Workforce Legislation
Licensure and Practice Rules
To address workforce shortages, states have bolstered their mental health workforce with changes to mental health professionals’ licensure and practice rules. These changes include: making out-of-state providers available with licensure reciprocity agreements (GA HB 26; KY SB 22; ND SB 2012; and WA SB 5054); creating new licensures for mental health-related professionals (NJ A 4608 and NJ A 1604); expanding/clarifying the scope of practice of specific health professionals (NH SB 225); and enabling providers to fulfill certain staffing requirements via telehealth (MD HB 570).

Financial Incentives for Workforce Recruitment

Providers report that recruiting and retaining well-trained staff is a major challenge due to low payment rates from insurers that limit the salaries they can offer potential employees. To incentivize individuals to pursue careers in mental health care and target that care to underserved populations, states have created programs that offer financial incentives, including student loan forgiveness for mental health professionals.

California’s AB 565 should be noted for adding county mental health programs as an eligible “practice setting” for an existing state loan forgiveness program. Often, mental health providers are inadvertently excluded from workforce incentive programs because the settings in which they provide care are not explicitly named as eligible sites in the original program.

Examples of 2019 Legislation Addressing Financial Incentives for Workforce Recruitment

</tr>
</tbody>
</table>
Peer Support Training and Certification

Using peer support workers to expand the mental health workforce and improve access to care has gained attention as a promising strategy across the country. Peer support workers draw upon their personal knowledge and lived experience to provide clients with education and support, make connections to other services, and promote recovery and resiliency. Depending upon their training and certification, they may provide either mental health and/or substance use support services.

In 2019, states worked to grow peer support services by establishing training and certification programs for mental health peer specialists.

* Denotes a bill that was vetoed.
Lived experience, culture, beliefs, sexual orientation, gender identity, values, race and language all affect how individuals experience mental health conditions. In fact, cultural differences can influence what treatments, coping mechanisms and supports work for a person with a mental health condition. Moreover, no one should be subject to practices that can cause or worsen mental health symptoms. The care and treatment a person receives should not only be evidence-based, but it should also reflect a person’s culture and identity.

People with mental health conditions have always faced stigma and discrimination. More than half of individuals with a mental health condition don’t receive treatment, and members of some communities, including Black, Indigenous and People of Color (BIPOC) and LGBTQI+, face even more barriers to accessing care and effective treatments. But when a person is able to access care, and that treatment incorporates cultural needs and differences, it can significantly improve outcomes.

**What does providing inclusive and culturally competent care look like?**

To provide effective care relevant to individuals’ experiences, states should include peers and families in any efforts to reform or change mental health systems. Inclusion of peers and families is not only important at the individual treatment level, but the voices of lived experience are also crucial to inform changes to mental health systems and can help ensure that the needs of those affected by mental illness are met. States should also work to prioritize policies that tailor mental health care to the needs of unique communities and ban discredited practices that can cause further trauma.

**Trends in Inclusive and Culturally Competent Care Legislation**

**Lived Experience Requirements for Advisory Bodies**

In 2019, several states commissioned formal advisory bodies to improve the state’s mental health system (such as Iowa’s efforts on children’s mental health, as noted on page 10 in the Early Intervention area of focus). Many of these advisory bodies specifically require the inclusion of peers and family members with lived experience of mental health conditions. These measures showcase the community-level impact of state mental health policies and provide for greater transparency and opportunity for community input on state mental health systems.

Bringing the voice of lived experience to the policymaking table is always a best practice, no matter how broad or specific the issue. Maine’s LD 40 required family members to be part of a Commission tasked with revamping the entire system serving children with behavioral health conditions and developmental disabilities. Meanwhile, Oregon’s SB 138 required a “consumer of mental health services” or a
“family member of a consumer” to be a part of the Mental Health Clinical Advisory Group, which advises the state on medication algorithms of psychiatric medications.

Ideally, the bodies will have multiple representatives from statewide mental health advocacy organizations that include openings for both individuals with direct lived experience and the lived experience of family members/caregivers to provide the broadest possible perspective of the mental health system from the peer and family communities.

Examples of 2019 Legislation Addressing Lived Experience Requirements for Advisory Bodies

Culturally Relevant Responses

Mental health care is also more effective when it is tailored to be relevant to the culture of the people it is serving. Increasingly, there has been a state legislative focus on studying and responding to mental health concerns, particularly suicide, within the context of specific populations, including military service members and veterans (AZ HB 2488 and NV SB 483), first responders (IL HB 2766 and NJ A 1028) and African Americans (NY A 6740B*).

**Banning of Discredited Practices**

Members of the LGBTQI+ community have been subjected to a “treatment” known as conversation therapy, a discredited practice that attempts to alter a person’s gender identity and/or sexual orientation. Research shows that conversion therapy is harmful, especially for LGBTQI+ youth, and can trigger depression, anxiety or self-destructive behavior. NAMI opposes the practice of conversation therapy and applauds the states that took action in 2019 to ban it.

OTHER AREAS OF FOCUS

People Get the Best Possible Care

Integration of Care
In order to improve the quality of mental health care that individuals and families receive, some states focused on increasing integration between primary and mental health care (IL SB 2085; WA SB 5432; and WA HB 1593), including through the use of behavioral health homes (OR SB 22). Integrated health care brings specialty mental health care together with primary care to better treat the whole person and improve health outcomes.

Involuntary Treatment
Regarding inpatient involuntary treatment (also known as inpatient commitment), the state of Hawaii enacted legislation to create a task force to examine existing laws and make recommendations to the legislature to reduce unnecessary emergency department admissions and improve access to the most appropriate level of care (HI HB 1013). States continue to develop policies on the use of involuntary outpatient treatment, also known as Assisted Outpatient Treatment (AOT). Building off trends from recent years, a few states expanded their commitment statutes and lowered outpatient commitment criteria (MD SB 0403; UT SB 39; and WA HB 1907).

NOTE: Any bills listed in the section are not included in the Bill Reference Resource. Use links for more information.
People Get Diverted from Justice System Involvement

When people are in a mental health crisis, they frequently encounter police rather than get medical attention. As a result, people with mental illness are over-represented in the criminal justice system. On any given day, approximately 44% of people incarcerated in jails and 37% of people in state and federal prisons have a history of mental illness. Jails and prisons have become America’s de facto mental health providers but are often unable to provide adequate care as part of a system that is not built to provide health services. That’s why NAMI prioritizes diverting people with mental health conditions from justice system involvement.

Diverting people from justice system involvement ensures that mental health crises get a mental health response. Every community should have robust crisis services for people experiencing a psychiatric emergency — allowing them to receive the help they need. Communities should also prioritize diverting people with mental health conditions to treatment and services at every opportunity — before arrest, after arrest and at all points within the justice system. For those who are already justice-involved, states should prioritize efforts to connect individuals with mental health conditions to care during and after incarceration.

In this section, we review trends in three key focus areas:

1. **Crisis Response**
2. **Diversion**
3. **Rehabilitation and Reentry**

The legislation covered in this section is aimed at providing appropriate care to people in a mental health crisis and keeping individuals connected to care by diverting them to treatment and supports rather than incarceration.
Any mental health crisis requires a safe and humane response. When people in crises don’t receive the care they need, they can instead end up in hospital emergency rooms, living on the streets, involved in the criminal justice system or losing their lives.

A mental health crisis should have a mental health response, ideally from a robust crisis care system. Sadly, people in a mental health crisis are often more likely to encounter police than to be connected to appropriate care, with tragic consequences. Receiving timely and appropriate crisis services can be the difference between life and death for individuals with serious mental illness, as nearly one in four people shot and killed by police officers since 2015 has had a mental health condition. Crisis care offers effective alternatives to a law enforcement-only response, including (but not limited to):

- Mobile crisis units
- Crisis hotlines
- Crisis centers
- Non-law enforcement crisis transportation

What does providing robust mental health crisis care look like?
Mental health crisis response services should be a vital part of states’ broader mental health systems. While crisis services are highly localized, state policymakers can facilitate community-level changes by requiring training and collaboration for key stakeholders and by offering funding mechanisms for desperately needed crisis services.

### Trends in 2019 Crisis Response Legislation

#### De-Escalation Training for First Responders
One strategy to help ensure that people in a mental health crisis do not end up in jail or prison is to provide training to first responders, primarily law enforcement, about the signs of mental health conditions and how to successfully de-escalate mental health crisis situations, often in the form of Crisis Intervention Team (CIT)-related training. In 2019, many states passed legislation to bolster their current mental health training requirements.

Note that beyond training, CIT and similar programs aim to not only train officers, but also forge ongoing partnerships between law enforcement, mental health treatment providers and the advocacy community (read more about this in our “Understanding the Issue” section on page 58).

Crisis Services

During a mental health crisis, and often after an initial law enforcement encounter, people with mental illness are too often taken to jail simply because “there’s nowhere else to go.” Unfortunately, the lack of robust crisis care means there is nowhere to divert people in a mental health crisis. To address this problem, states have passed legislation to invest in building out crisis service systems that include 24/7 crisis treatment centers, crisis lines and mobile crisis outreach teams.

By setting aside funding for mental health crisis service centers and a mobile crisis unit, New Hampshire’s enacted SB 11 was a 2019 highlight in mental health crisis services legislation. The law was enacted to help address significant psychiatric boarding. Read more about NAMI New Hampshire’s effort to draw attention to this issue in the Advocacy Spotlight on page 56.

In New Hampshire, if someone goes to the emergency room because they are having a mental health crisis, they consistently find that the hospital has no inpatient capacity to treat them. While the hospital would normally transfer the patient to another hospital or center that specializes in mental health, there aren’t enough beds statewide to accommodate the number of people in need. Patients are stuck waiting, with minimal care, in emergency rooms until a bed opens somewhere, a problem known as “psychiatric boarding.”

NAMI New Hampshire has been a longtime, vocal advocate against psychiatric boarding. NAMI New Hampshire Executive Director Ken Norton has described the issue as “medically, legally, morally, ethically, and economically wrong.” Through their advocacy, NAMI New Hampshire has made the issue a priority for state policymakers and successfully pressed the state to track and release data on how many people were being boarded each day.

NAMI New Hampshire and other organizations helped shape legislation, Senate Bill 11 (SB 11), to address psychiatric boarding by increasing resources for the mental health service delivery system. The legislation not only set aside funding for crisis service centers and a mobile crisis unit, but it also ensured that people who are involuntarily hospitalized receive a timely hearing. Additionally, SB 11 provided a mechanism for hospitals to be reimbursed for people who are held in emergency rooms, which NAMI New Hampshire hopes will lead to better conditions for those waiting on a bed.

NAMI New Hampshire first drew attention to this issue with a large press conference in 2013. Once the state began releasing data on how many people were being boarded, NAMI New Hampshire started posting those numbers on social media twice per week. These posts drew a lot of attention and comments, and were widely shared, which in turn garnered a lot of media attention. Norton also took this data directly to Governor Chris Sununu (R) when he took office in 2017.

SB 11 emerged in part from a 10-Year Mental Health Plan, developed by the state to increase mental health resources and quality of care. That plan came from legislation
NAMI New Hampshire helped craft in 2017 (House Bill 400, which required creation of a new mental health plan). A delay in completion of the 10-year plan resulted in numerous mental health bills being introduced, which created confusion and conflict among advocates who had been hoping that the 10-year plan would prompt the state legislature to produce a more comprehensive reform bill.

Advocates argued whether psychiatric boarding should take top priority or if, instead, they should focus on other elements of the 10-year plan. Eventually, NAMI New Hampshire and others were able to coalesce support around SB 11 by reaffirming the commitment that they would continue to fight for all elements of the 10-year plan, including and beyond SB 11.

The enactment of SB 11 takes an important step forward in realizing the vision of the 10-Year Mental Health Plan. Although the fight for adequate crisis resources is not over, SB 11 will help “divert people from the hospital, law enforcement and incarceration,” explained Norton. He added that SB 11 was made possible by “incredible compromise, ongoing discussions and political maneuvering” by the mental health advocacy community together with legislators from both parties determined to move mental health reform forward. NAMI New Hampshire was thrilled when Governor Sununu asked if he could sign the bill at their office, and there was a big turnout of legislators, advocates, families, and people who had experienced psychiatric boarding, and media on hand as the bill was signed into law.

**NAMI New Hampshire’s Keys to Success**

Looking back at the passage of SB 11, NAMI New Hampshire shared the following advice for other mental health advocates:

**Stay on Message**

Stay united with other organizations whenever possible and emphasize commitment to common goals.

**Leverage the Power of Data**

To increase awareness and attract media attention, use clear and convincing data to illustrate the issue at hand.
People with mental illness are overrepresented in our nation's criminal justice system. A main contributor to this issue is the absence of comprehensive crisis systems and a reliance on law enforcement to address the needs of people experiencing a mental health crisis. But a mental health crisis deserves a mental health response, which is why many communities are developing crisis response systems to effectively divert people with mental illness away from the justice system and into mental health care.

Effective crisis response must work across systems to meet the needs of people experiencing a mental health crisis, so community partnerships involving a variety of stakeholders are essential when building a local crisis response system. Strong partnerships with key stakeholders involved can help gain buy-in for developing and sustaining a new system, help inform aspects of the new crisis system, and support the work of implementation and ongoing sustainability.

Some key partners might include:

**Law Enforcement**
Despite the importance of reducing the role of law enforcement in mental health crisis, they are currently the primary responders to mental health crises in most communities. Their knowledge of current crisis response can be essential to identifying gaps and opportunities. There also may be instances where law enforcement will need to be part of a crisis response, so getting their buy-in early is helpful.

**Mental Health Providers and Local Agencies**
Mental health providers can provide insights into crisis response, particularly current barriers to developing and sustaining crisis services. It is also important to have leaders from local mental or behavioral health departments involved in any efforts. New services will be part of developing a crisis response system and these groups will be important in developing, operating and coordinating those services.

**Mental Health Advocates**
Many advocacy groups, such as NAMI, are already engaged in advocating for alternative crisis responses. Advocates play a key role in engaging policymakers and leaders, ensuring that resources and policies are committed to sustain the crisis response system. Advocates should not only be involved in raising awareness around the problems with the current system, but also ensuring that any response meets the needs of those with mental illness who have had direct interactions with the local crisis care system.

**Hospitals**
People in crisis are often taken to emergency rooms for evaluation and acute care, regardless of whether the hospital offers any kind of psychiatric care or not. Including hospital executives or leaders can support coordination with other health care providers to reduce delays to care for individuals in need.

**Emergency Services**
Emergency medical services (EMS), firefighters and 911 call centers can all play a role in responding to a
mental health crisis. Not only can they help identify current gaps and opportunities for developing a crisis response system, but their resources might also be used in a new crisis response.

Other partners to consider include leaders from homelessness services and shelters, workforce development centers or other social services providers. While they might not be involved in an immediate crisis, the ultimate goal of robust crisis care is to help people stay in the community, and these organizations are part of ongoing care and support. Business leaders and local policymakers (such as mayors, governors, city managers or county commissioners) can also be a key to ensuring the crisis response system you are developing receives the resources it needs.

Chapters 1 and 2 of the CIT International guide, *Crisis Intervention Team (CIT) Programs: A best practice guide for transforming community responses to mental health crises*

SAMHSA’s *National Guidelines for Behavioral Health Crisis Care: Best Practice Toolkit*
When individuals experiencing mental health symptoms come to the attention of law enforcement, communities should have policies and programs to divert them to treatment and other services — before arrest, after arrest and at all points in the justice system.

Two million times a year, people with serious mental illness are booked into America’s jails and prisons. Criminalizing mental health conditions is ineffective and costly for states and harmful to the individuals who are incarcerated, their family members and their community.

What does diversion look like?
Helping people avoid or get out of jail and into community alternatives is a top priority for NAMI. Diversion programs can help ensure that individuals are guided to mental health services and supports as an alternative to incarceration. NAMI supports a variety of approaches to diverting individuals from unnecessary incarceration into appropriate treatment, including pre-booking (police-based) diversion, post-booking (court-based) diversion, alternative sentencing programs and post-adjudication diversion (conditional release).

Trends in 2019 Diversion Legislation
Mental Health Courts and Diversion Programs
Ideally, mental health diversion takes place pre-arrest or pre-booking, so individuals avoid incarceration altogether. However, post-arrest or post-booking diversion programs are the more common type of jail diversion. Mental health courts, specialized courts that give individuals suspended sentences in exchange for completion of a court-ordered treatment plan, are an example of a post-arrest diversion program. In 2019, New Hampshire and Texas enacted legislation dedicated to creating and expanding their mental health courts. Notably, Washington increased access to pre-booking diversion with SB 5444, which gives law enforcement the authority they need to divert individuals to treatment instead of arresting them.

Once incarcerated, many individuals lose access to needed medications and other treatment services and end up getting worse, not better. In fact, less than half of people (45%) with a history of mental illness receive mental health treatment while held in local jails.

And individuals with a mental illness stay in jail longer than their counterparts without mental illness. They are at risk of victimization and, often, their mental health conditions can get worse.

Most of the individuals who are incarcerated are not violent criminals, and most people in jails have not even gone to trial yet, so they have not been convicted of a crime. Many others are serving short sentences for minor crimes. In addition to having inadequate access to mental health care in jail, this problem continues after individuals are released. After leaving jail, many individuals no longer have health insurance coverage and no connection to community-based health care. A criminal record often makes it hard for individuals to get a job or housing. Many individuals, especially without access to mental health services and supports, have a difficult time successfully re-entering the community and avoiding re-incarceration.

**What does successful rehabilitation and reentry look like?**

Individuals should experience a timely competency evaluation and restoration process to reduce the amount of time spent in jail. Additionally, when individuals are in jail or prison, they should have access to needed medication and support, be exposed to opportunities to further their education and future employment opportunities, and should not be subjected to harmful practices, such as solitary confinement.

As they approach their release date, individuals should be signed up for health coverage before release, if possible, and should get extensive help planning for their basic needs to ensure they get back on track. This should include, but is not limited to, connections to a community-based mental health treatment provider (including setting up an initial appointment), safe and stable housing, income support, food assistance, and continued support with their education and finding a job.

**Trends in 2019 Rehabilitation and Reentry Legislation**

**Competency Restoration**

For any criminal trial to move forward, courts must first determine that the defendant is competent to stand trial. For people with mental illness, they can spend months waiting for a competency evaluation and even longer for competency restoration services, which typically involves psychiatric services. This creates a
backlog of court cases and greatly extends the amount of time people with mental health conditions are forced to stay in jail.

Fortunately, states can take legislative action to create a timelier process for competency evaluations and restorations.

Examples of 2019 Legislation Addressing Competency Restoration

</tbody>
</table>
**Solitary Confinement**

Solitary confinement can trigger and worsen mental health symptoms and increases the risk of suicide and self-harm. Solitary confinement is particularly harmful for individuals with mental health conditions, and NAMI urges all federal, state and local corrections officials to use alternatives to solitary confinement for this population.

Recognizing the evidence on the dangers of solitary confinement, some states passed laws restricting its use in 2019.

Health Services for Justice-Involved Populations

Strengthening access to health care for people who are incarcerated and re-entering the community helps to both improve their mental health and reduces the likelihood that they will return to jail or prison. In 2019, states took measures to improve the health of justice-involved populations, including by increasing reimbursement rates for health services provided in correctional settings (NC H 106), providing navigator services to those re-entering the community (WA SB 5444), and implementing changes to connect correctional health systems with community-based health care systems (OR SB 973). Additionally, Nevada became the fourth state to ban private prisons, citing concerns that for-profit correctional institutions can jeopardize inmates’ access to health care (NV AB 183).

A notable highlight for promising policy promoting health services for justice-involved individuals is Washington’s SB 5444, which created the position of Forensic Navigator. This new position is designed to help people with mental health conditions connect to services in the community with the aim of stopping the revolving door in and out of our corrections system.

Conclusion

2019 was a very active year in state policymaking on mental health. Across the states, clear areas of progress and focus emerged. Notably, states are bringing mental health and suicide prevention into their formal education curriculums, which is a critical step forward in helping youth understand how to recognize mental health conditions and how they can find support for themselves or a loved one.

Mental health advocates also repeatedly mobilized against harmful state legislation or administrative efforts that threatened Medicaid funding for mental health services and Medicaid coverage for people with mental health conditions. At the same time, advocates were active in reforming parts of the commercial insurance markets by passing laws that mandate more active and transparent enforcement of the federal parity law.

Finally, reforming mental health crisis response was a clear priority for many states. While NAMI envisions a world in which a robust mental health crisis service system exists to support people in crisis, law enforcement officers remain the de facto response in many areas. Fortunately, states are increasingly passing legislation to create alternatives to law enforcement response, such as mobile crisis teams and crisis treatment centers.

It is worth mentioning that this report was compiled in 2020 as we experienced the outbreak of COVID-19 and a national economic downturn, making 2020 a year like no other. COVID-19 has rocked the nation’s mental health with a rapid increase in the number of individuals experiencing symptoms of mental health conditions for the first time, and those with existing conditions seeing their symptoms worsen. As of this writing, the CDC reports that one-third of people in the U.S. now meet the clinical criteria for depression or anxiety.

Our nation’s public health crisis goes beyond COVID-19 as we grapple with the mental health impact of not only the pandemic, but the economic crisis and recent efforts to address racial injustice. States’ support of mental health will be more critical in the years to come than ever before.

NAMI’s national office and NAMI State Organizations will be closely watching how states support mental health during this time and will fight to ensure that people with mental health conditions and their families have the resources they need to survive and thrive.
